Resumen

PAdicMIDI es un programa de cómputo escrito en Python 3.10+ que implementa, por primera vez en software de uso público, el marco del *Análisis Aritmético-Topológico de Datos* (ATDA) aplicado a música simbólica. Dado un archivo MIDI estándar, el programa:

- 1. construye una *torre p -ádica de espacios de patrones* $\{D_{p,n}\}_{n \geq 0}$ a partir de la serie cromática beat-síncrona o segundo-síncrona del MIDI;
- 2. define explícitamente el sistema inverso forzado $\pi_{n+1,n}: S_{n+1} \rightarrow S_n$;
- 3. calcula el *invariante de coherencia* $\text{Coh}_\pi(p,n) \in [0,1]$ y lo compara con el *piso nulo arquitectónico* $1/p$ predicho por la Proposición 3.1 del segundo artículo asociado.

El paquete reproduce exactamente, con tolerancia bit-equivalente en macOS arm64, los valores numéricos publicados en dos manuscritos sometidos a revista en 2026; entrega además un *applet HTML autocontenido* (un solo archivo de ~ 35 -KB) que ejecuta el análisis dentro del navegador del usuario, sin instalación, sin red, sin telemetría.

Este documento integra en un único PDF imprimible: la motivación matemática, la arquitectura del software, las instrucciones de instalación y uso, la descripción del applet web, la suite de reproducibilidad (28 tests), el listado completo del código fuente y los manifiestos criptográficos para el registro INDAUTOR.

Palabras clave: análisis p -ádico, ultramétrica, música simbólica, MIDI, completación profinita, agrupamiento jerárquico, recuperación de información musical, análisis topológico de datos.

1 Introducción

1.1 ¿Qué es PADicMIDI?

PADicMIDI nace del programa de investigación del grupo **P-ADAGIO** (CIMAT-Mérida), cuyo eje teórico es el *Análisis Aritmético-Topológico de Datos* (ATDA): una metodología que estudia series temporales discretas a través de sus reducciones módulo potencias de un primo p , sus completaciones profinitas y los invariantes topológicos asociados a las jerarquías que tales completaciones inducen.

Esta primera versión pública del software encarna el caso de uso más maduro del programa: el análisis de *música simbólica* representada en formato MIDI. La música simbólica es un dominio ideal para ATDA por tres razones:

1. posee una jerarquía métrica intrínseca (compases, subdivisiones, figuras rítmicas) que se presta naturalmente a una indexación p -ádica con $p \in \{2, 3\}$;
2. dispone de corpus benchmark con licencia abierta (Mutopia, Bach Suites BWV~1007–1012);
3. las afirmaciones cuantitativas del marco son falsables: el *piso nulo* $\text{Coh}_\pi(p, n) = 1/p$ es una predicción exacta, no una correlación estadística aproximada.

1.2 ¿Qué problema resuelve?

El problema central que aborda PADicMIDI es el siguiente:

Dada una pieza musical en MIDI, ¿en qué medida la jerarquía métrica binaria, ternaria, quintaria o septenaria que aparentemente articula la pieza — compases binarios, tresillos, etc. — está realmente codificada en el contenido de altura y ritmo, y no sólo declarada en la notación?

La respuesta clásica de la musicología computacional consiste en usar descriptores estadísticos (entropía rítmica, autocorrelación, etc.). PADicMIDI propone una respuesta categóricamente distinta: cuantizar la serie en *ventanas de longitud p^n* (las *bolas p -ádicas*), agrupar las ventanas en prototipos por k -medias, forzar el sistema inverso $\pi_{n+1, n}$ entre los espacios de prototipos sucesivos, y medir si el cuantizador del nivel padre “adivina” al cuantizador del nivel hijo. Esta métrica es el invariante $\text{Coh}_\pi(p, n)$.

El resultado central, demostrado en los manuscritos asociados y verificado computacionalmente por la suite `tests/paper_values/`, es:

Bajo las hipótesis estructurales (SC) de cobertura entre hermanos y (AI) de inclusión-ancestro, el invariante satisface exactamente $\text{Coh}_\pi(p, n) = 1/p$ para todo nivel $n \geq 1$.

Las piezas que satisfacen las hipótesis (por ejemplo, los preludios y gigas monofónicos de Bach analizados con $p = 2$) reproducen este piso con coincidencia bit-equivalente. Las piezas polifónicas y de textura densa (Bach Concerto para tres clavecines BWV~1063, Conciertos de Brandenburgo BWV~1049 y BWV~1050, *Musikalisches Opfer* BWV~1079, etc.) se desvían medibles del piso, lo que da origen a un nuevo *descriptor cuantitativo de textura* que no requiere etiquetado supervisado.

1.3 ¿Por qué es novedad?

PADicMIDI es novedad por la combinación inusual de tres propiedades:

1. **Originalidad teórica.** La torre $D_{p,n}$, el sistema inverso forzado y el piso nulo $1/p$ son construcciones introducidas por el autor; ningún paquete previo de análisis de música simbólica (`music21`, `muspy`, `miditok`, `pyAMPACT`, ...) implementa estas operaciones ni cuantiza ventanas en bolas p -ádicas.
2. **Falsabilidad cuantitativa.** A diferencia de los descriptores estadísticos clásicos, la afirmación “ $\text{Coh}_\pi(2, n) = 0,500$ exacto en el preludio BWV~1007” es una ecuación numérica binaria, no una correlación aproximada. La suite `tests/paper_values/` verifica este tipo de afirmaciones en cada commit.
3. **Reproducibilidad bit-equivalente.** Las dependencias están congeladas en `requirements-pinned.txt`; las semillas del PRNG son fijas; el script `scripts/reproduce.sh` regenera los CSV publicados en los artículos asociados, byte por byte, en `macOS arm64`.

1.4 Estructura de este documento

La sección~2 resume el marco matemático; la sección~3 describe la arquitectura del software; la sección~4 contiene las instrucciones de instalación y ejecución (incluyendo el ejecutable unificado `padicmidi` y los cinco subcomandos especializados); la sección~5 documenta el applet web autocontenido; la sección~6 describe la suite de reproducibilidad y validación; la sección~7 contiene los datos para registro autoral; y los apéndices incluyen el código fuente completo y los manifiestos criptográficos.

2 Marco matemático

Esta sección resume las definiciones, hipótesis y proposición central que el software computa. Para detalles formales, ver los manuscritos asociados [1, 2].

2.1 Serie cromática

Sea M un archivo MIDI con K notas $(t_k, \text{pitch}_k, \text{vel}_k)_{k=1}^K$, donde t_k está expresado en pulsos (*beats*) o en segundos según el eje elegido. La *serie cromática* con bin $\Delta_b > 0$ es la función $x: \{0, 1, \dots, T-1\} \rightarrow \{0, 1, \dots, 11\}$ definida como la moda de las clases de altura $\text{pitch}_k \bmod 12$ activas en cada bin de tiempo $[m\Delta_b, (m+1)\Delta_b)$, con $T = \lceil t_K/\Delta_b \rceil$. Por defecto $\Delta_b = 1/12$ pulsos.

2.2 Torre p -ádica de patrones

Para $p \in \{2, 3, 5, 7\}$ y $n \in \{0, 1, \dots, N_{\text{máx}}\}$, sea $W_n = p^n$ la longitud de ventana en el nivel n . La familia de *ventanas* en el nivel n es

$$V_n = \{x[m : m + W_n] : m = 0, \text{step}, 2 \text{ step}, \dots\}$$

con un paso `step` configurable. Por agrupamiento de las ventanas en V_n en $K_n = K \cdot p^{\text{máx}(0, n-1)}$ prototipos vía k -medias con métrica L^2 ponderada (peso α para los componentes cromáticos), se obtiene un *cuantizador* $\phi_n: V_n \rightarrow S_n = \{1, \dots, K_n\}$.

Definición 2.1 (Sistema inverso forzado). El sistema inverso $\pi_{n+1,n}: S_{n+1} \rightarrow S_n$ se define forzando que cada prototipo de nivel $n + 1$ herede explícitamente un “padre” en el nivel n , según la regla:

$$\pi_{n+1,n}(s) = \arg \max_{t \in S_n} \# \{m : \phi_{n+1}(x[m : m + W_{n+1}]) = s \wedge \phi_n(x[m : m + W_n]) = t\}.$$

Definición 2.2 (Coeficiente de coherencia Coh_π).

$$\text{Coh}_\pi(p, n) := \frac{\# \{(s, t) \in S_{n+1}^2 : s \neq t, \pi_{n+1,n}(s) \neq \pi_{n+1,n}(t)\}}{\# \{(s, t) \in S_{n+1}^2 : s \neq t\}}.$$

Proposición 2.3 (Piso nulo arquitectónico). Si la torre $\{D_{p,n}\}_n$ satisface las hipótesis estructurales (SC) sibling cover y (AI) ancestor inclusion, entonces

$$\text{Coh}_\pi(p, n) = \frac{1}{p}, \quad \forall n \geq 1.$$

Pisos numéricos: $p = 2 \rightarrow 0,500$, $p = 3 \rightarrow 0,333\bar{3}$, $p = 5 \rightarrow 0,200$, $p = 7 \rightarrow 0,142857\overline{142857}$.

Corolario 2.4 (Filtro de aridez p -ádica). Cuando el cociente de ramificación r del cuantizador coincide con el primo p de la torre, $\text{Coh}_\pi(p, n) = 1/p$ exactamente; cuando $r \neq p$, la señal de diferenciación escapa y $\text{Coh}_\pi(p, n) > 1/p$ estrictamente.

2.3 Hallazgo empírico

El benchmark BWV~1007 (preludio monofónico) reproduce $\text{Coh}_\pi(2, n) = 0,500$ exactamente para todo $n \geq 1$ y para ambos ejes (beats, segundos). Los corpus polifónicos de Bach (BWV~1049, 1050, 1079, Goldberg) se desvían del piso de manera medible, lo que constituye el descriptor de textura mencionado en la introducción.

3.2 Métricas de tamaño

Componente	Descripción	Líneas
core/echo.py	Motor numérico Phase I	1 818
core/hierarchical.py	Torre p -ádica + Coh_π	428
core/config.py	Constantes globales	37
io/midi_mido.py	Adaptador mido	22
io/midi_pretty.py	Adaptador pretty_midi	68
analysis/*	Cuatro módulos de análisis	604
cli/*	Seis ejecutables CLI	652
Subtotal código fuente Python		3 629
tests/	28 tests (smoke/unit/reg./paper)	~700
web-demo/applet.html	Applet autocontenido (EN, JS+HTML)	~820
web-demo/applet-es.html	Applet autocontenido (ES)	~820

3.3 Dependencias

Dependencias de tiempo de ejecución (rangos flexibles, ver `pyproject.toml`):

- `numpy` ≥ 2.0 , < 3.0
- `scipy` ≥ 1.13 , < 2.0
- `networkx` ≥ 3.2 , < 4.0
- `scikit-learn` ≥ 1.4 , < 2.0
- `matplotlib` ≥ 3.8 , < 4.0
- `mido` ≥ 1.3 , < 2.0
- `joblib` ≥ 1.3 , < 2.0
- `pretty_midi` $\geq 0.2.10$ (opcional)

Para reproducibilidad bit-equivalente se proporciona `requirements-pinned.txt` con las versiones exactas verificadas en macOS arm64 con Python 3.13.3.

4 Instalación y uso

PAdicMIDI ofrece **tres niveles de uso**, en orden creciente de fricción y de control:

1. **Cero instalación** — abrir el applet HTML autocontenido en cualquier navegador moderno (sec.~5).

2. **Ejecutable de línea de comandos** — `padicmidi` y sus cinco subcomandos (sec.~4.2).
3. **API Python** — llamar a `run_hierarchical_from_midi` desde un script o notebook (sec.~4.3).

4.1 Instalación del paquete

Requisitos previos. Python 3.10 o superior; git para clonar el repositorio.

```
git clone https://github.com/yoyontzin/padicmidi.git
cd padicmidi
python3 -m venv .venv
source .venv/bin/activate

# Instalación con dependencias mínimas (modo editable):
pip install -e .

# Para reproducibilidad bit-equivalente con los CSV publicados:
pip install -r requirements-pinned.txt

# Para usar el adaptador opcional pretty_midi:
pip install -e ".[pretty]"

# Para correr la suite de tests:
pip install -e ".[dev]"
pytest tests/
```

Tras la instalación, los **seis ejecutables CLI** quedan disponibles en el PATH del entorno virtual:

Ejecutable	Función
<code>padicmidi</code>	Despachador unificado (recomendado)
<code>padicmidi-run-one</code>	Análisis de un único archivo MIDI
<code>padicmidi-run-suite</code>	Análisis de un corpus completo
<code>padicmidi-benchmark</code>	Benchmark canónico BWV~1007
<code>padicmidi-job-list</code>	Generación de listas de trabajos
<code>padicmidi-mutopia</code>	Descarga de MIDIs CC desde Mutopia

4.2 Uso por línea de comandos

Ejecutable principal: `padicmidi`. Sin argumentos imprime la ayuda con la lista de subcomandos:

```
$ padicmidi --help
padicmidi v1.0.0 -- p-adic hierarchical analysis of symbolic music
Author: J. Rogelio Pérez-Buendía (CIMAT-Mérida) · ORCID 0000-0002-7739-4779

Usage:
  padicmidi <subcommand> [arguments...]
  padicmidi --help
  padicmidi <subcommand> --help

Sub-commands:
  run-one   Analyse a single MIDI file (one piece, one prime).
  run-suite Analyse a corpus across multiple primes and axes.
  benchmark Run the canonical BWV 1007 benchmark.
  job-list  Generate a job list for a corpus.
  mutopia   Download CC-licensed MIDI files from Mutopia.
```

Ejemplo 1 — BWV 1007 con $p=2$ y $N_{\max}=5$.

```
$ padicmidi run-one data/midi/bwv1007-1.mid bwv1007_pre beats 2 5 \
  --K 16 --Kchild 2 --M 800 --step 2 --seed 42 \
  --out results_local/bwv1007_pre/beats/p2

$ cat results_local/bwv1007_pre/beats/p2/coherence_hier_p2.csv
n,Coh_pi,Coh_grid,n_samples_n,n_samples_nplus1
1,0.5,0.5,1,2
2,0.5,0.5,2,4
3,0.5,0.5,4,8
4,0.5,0.5,8,16
5,0.5,0.5,16,32
```

El valor exacto $\text{Coh}_\pi(2, n) = 0,5$ es el piso nulo arquitectónico predicho por la Proposición~2.3.

Ejemplo 2 — Benchmark canónico.

```
$ padicmidi benchmark --out results_local/benchmark/
```

Esto reproduce los CSV de referencia almacenados en `results/verified/` y los compara contra los hashes documentados en `results/verified/CHECKSUMS.txt`.

4.3 Uso programático (API Python)

```
1 from padicmidi import run_hierarchical_from_midi
2
3 resultado = run_hierarchical_from_midi(
4     midi_path="data/midi/bwv1007-1.mid",
5     p=2,
6     axis="beats",
7     nmax=5,
8     K=16,
9     Kchild=2,
10    M=800,
11    step=2,
12    seed=42,
13 )
14
15 for fila in resultado["coherence"]:
16     print(fila)
17 # {'n': 1, 'Coh_pi': 0.5, 'n_samples_n': 1, 'n_samples_nplus1': 2}
18 # {'n': 2, 'Coh_pi': 0.5, ...}
19 # ...
```

5 Applet web autocontenido

5.1 Descripción

PADicMIDI incluye un **applet HTML autocontenido** que re-implementa el motor en JavaScript vainilla y permite ejecutar el análisis sin instalar nada. El applet se distribuye en dos versiones idénticas en funcionalidad pero con la interfaz traducida:

- `web-demo/applet.html` — inglés (default).
- `web-demo/applet-es.html` — español.

Cada archivo pesa ~ 100 -KB e incluye, embebidos en base64, **cuatro demos MIDI**: el preludio de la primera Suite para violonchelo de Bach (BWV~1007, Mutopia, dominio público), dos sintéticos generados por el propio paquete (`toy_binary.mid` y `toy_ternary.mid`) y el canon cangrejo del *Musikalisches Opfer* (BWV~1079) como ejemplo polifónico de contraste. Cada demo lleva, en la propia interfaz, los valores esperados de Coh_π para $p = 2$ y $p = 3$, lo que permite verificar a ojo que el applet reproduce el piso nulo arquitectónico.

5.2 Cómo usarlo

1. Abrir el archivo HTML con doble clic (funciona en macOS, Linux, Windows; cualquier navegador moderno con soporte de ES2020).
2. Pulsar uno de los **cuatro botones de demo** (BWV~1007, toy binario, toy ternario o BWV~1079) o arrastrar cualquier MIDI estándar sobre la zona indicada.
3. Elegir el primo $p \in \{2, 3\}$ y el nivel máximo $N_{\text{máx}}$.
4. Pulsar “Ejecutar análisis” para obtener la tabla de $\text{Coh}_\pi(p, n)$ y las **cuatro vistas musicales** (sec.~5.4), o pulsar “Diagnóstico p -aridad” para obtener las **cinco gráficas espectrales** del paper aplicado (sec.~5.4).
5. Una cabecera de identificación de corrida (timestamp, archivo, huella SHA, parámetros) etiqueta inequívocamente cada análisis; el botón “Reiniciar” limpia la sesión.

5.3 Visualizaciones musicales (sección 4 del applet)

A diferencia de un único árbol abstracto, el applet ofrece cuatro visualizaciones encadenadas que muestran *qué* está mirando el método dentro de la pieza. Un selector de nivel $n \in \{1, \dots, N_{\text{máx}}\}$ refresca las cuatro de manera coordinada.

4.1 La pieza coloreada por prototipo. Cromograma a lo largo del tiempo (12 clases de altura $\times$ tiempo; intensidad azul codifica activación cromática) con una franja inferior coloreada según qué prototipo cuantiza cada ventana de longitud p^n . Es la *huella temporal* del nivel: los cambios de color marcan transiciones musicalmente relevantes (modulaciones, cortes seccionales). Una leyenda lista los conteos de ventanas asignados a cada prototipo.

4.2 Catálogo de prototipos del nivel. Cada prototipo se renderiza como un mini-cromograma SVG de tamaño $12 \times p^n$ que enseña su contenido cromático real. El recuadro de color de cada tarjeta coincide con la franja temporal de 4.1, de modo que el observador puede leer dónde aparece cada patrón en la pieza. Cada tarjeta también reporta el número de ventanas asignadas y el padre π heredado.

4.3 Sistema inverso pi. Diagrama tipo Sankey del mapeo $\pi_{n+1,n} : S_{n+1} \rightarrow S_n$. En la fila superior aparecen los prototipos del nivel padre y en la inferior los del hijo, conectados por curvas Bézier coloreadas según el padre heredado. El pie del diagrama muestra el valor calculado de $\text{Coh}_\pi(p, n)$ y el piso arquitectónico $1/p$, lo que permite contrastar visualmente la consistencia muestral con el predicho por la Proposición.

4.4 Árbol p-ádico completo. La torre completa $S_1 \rightarrow S_2 \rightarrow \dots \rightarrow S_{N_{\text{máx}}}$ con nodos coloreados por la herencia desde su raíz, de manera que las *ramas* del árbol son visualmente coherentes con las franjas y tarjetas de las vistas anteriores. Las aristas (más tenues) muestran el sistema inverso π a lo largo de toda la torre.

5.4 Diagnóstico p-aridad (sección 5 del applet)

Las visualizaciones de la sección~4 del applet inspeccionan la estructura interna del invariante Coh_π (paper teórico). El paper *aplicado*, en cambio, se construye sobre una familia distinta de invariantes: las propiedades espectrales del **grafo k-NN** levantado sobre las ventanas $D_{p,n}$ a cada nivel. La sección~5 del applet reproduce esos invariantes y los grafica para $p = 2$ frente a $p = 3$, replicando dentro del navegador el flujo implementado en `padicmidi.core.echo.run_tower_on_beats`.

A nivel n se construyen las ventanas $\{a : \mathbb{Z}/p^n\mathbb{Z} \rightarrow X\}$ deslizándose sobre la serie beat-sincrónica $X(u) = [H(u); \alpha a(u)] \in \mathbb{R}^{13}$ con paso `step=2`, submuestreadas linealmente a un techo `cap=300`. La distancia entre patrones es $d_n(a, b) = \sqrt{\frac{1}{N} \sum_i \|a_i - b_i\|^2}$ con $N = p^n$. Sobre los patrones se construye el grafo k-NN simetrizado $G_n^{(p)}$ con $k = 10$ vecinos por defecto, y se reportan los siguientes cinco invariantes:

- $\beta_0(p, n)$ — número de componentes conexas (BFS).
- Fracción del componente gigante, $|C_{\text{máx}}|/V$.
- Grado promedio, $\bar{d} = 2E/V$.
- Coeficiente de *clustering* medio (Watts–Strogatz local).
- $\lambda_2(p, n)$ — segundo valor propio del Laplaciano normalizado (vector de Fiedler), calculado por iteración del poder con deflación sobre el componente gigante.

El applet calcula los cinco invariantes para $p \in \{2, 3\}$ y los grafica en cinco mini-paneles SVG superpuestos (figura~1); el cálculo total sobre una pieza típica (`cap=300`, $N_{\text{máx}} = 4$) toma entre 0,4 y 2~segundos en un navegador moderno. Cada corrida lleva una cabecera de identificación (timestamp, archivo, huella SHA, parámetros) y produce además un *resumen automático* comparativo de la forma “ $\beta_0(p = 2) = 1,75$ vs $\beta_0(p = 3) = 1,00 \Rightarrow p = 3$ ”. La descarga del CSV combinado (`padicmidi_diag_<huella>.csv`) permite reabrir los mismos números en Python o en un cuaderno de cálculo.

La validación numérica de la implementación JavaScript se realizó contra `run_tower_on_beats` ejecutado sobre BWV~1007 con los mismos hiperparámetros: el número de vértices V coincide exactamente, las aristas E difieren en $\leq 1\%$ por empates de distancia, $\bar{d}$ en $\leq 0,5$, β_0 es exacto excepto en un único nivel donde difiere por uno, y la fracción del componente gigante coincide con tolerancia $\leq 0,07$. Esto garantiza que la sección~5 del applet reproduce, dentro del navegador y sin instalar nada, las figuras canónicas del paper aplicado (J.~R.~Pérez-Buendía, 2026, *Profinite hierarchical patterns and prime-indexed multiscale graph diagnostics*).

5.5 Garantías de privacidad

El applet es **cero red**: no realiza peticiones HTTP de ningún tipo, no carga recursos externos, no usa cookies, no usa `localStorage`, no genera telemetría. El único archivo al que accede es el MIDI que el usuario carga, y dicho archivo nunca sale del navegador. Esta propiedad es relevante

Los valores por omisión reproducen las corridas de referencia de los artículos asociados (J. R. Pérez-Buendía, 2020), con la salvedad de que la implementación en el navegador utiliza un parser MIDI simplificado limitado a flujos monofónicos; para reproducibilidad completa use el paquete Python.

5. Diagnóstico p-aridad — invariantes espectrales del grafo k-NN (Paper 1)

Estas son las figuras canónicas del paper aplicado: en cada nivel n se construye el grafo k-NN sobre las ventanas de longitud p^n (cap=300, k=10 por defecto, RMSE como distancia). Comparamos $p=2$ vs $p=3$: cuando el primo correcto coincide con la métrica de la pieza, los invariantes se separan visiblemente.

k vecinos cap $N_{\text{máx}}$ calculado en 0.00 s · 474 notas · T=1537

DIAGNÓSTICO P-ARIDAD · 8:06:42 P.M.

archivo: **bwv1007-1.mid (demo precargado)**

474 notas · serie T=1537 · tiempo de cálculo 0.00 s

parámetros: k=10, cap=300, $N_{\text{máx}}=4$

huella SHA: 9396a496

● $p=2$ ● $p=3$

cinco invariantes vs nivel n

Descargar CSV ($p=2 + p=3$)

Promedios: $\beta_0(p=2)=1.75$ vs $\beta_0(p=3)=1.00$ (menor = más conexo) → $p=3$ · $\lambda_2(p=2)=0.0870$ vs $\lambda_2(p=3)=0.0900$ (mayor = mejor expansión) → $p=3$.

Acerca de

Figura 1: Sección~5 del applet (versión española, demo BWV~1007). De izquierda a derecha y arriba a abajo: β_0 , fracción del componente gigante, grado promedio, *clustering* medio y λ_2 de Fiedler vs nivel n , comparando $p = 2$ (azul) y $p = 3$ (naranja). La cabecera azul identifica la corrida (archivo, huella SHA, parámetros) y el pie resume cuál primo “gana” por mayoría sobre los cinco invariantes. Para BWV~1007 la torre se vuelve totalmente conexas desde el nivel $n = 2$ con ambos primos: el invariante actúa como *diagnóstico de robustez*, no como certificación automática de aridad.

tanto para la privacidad del usuario como para la portabilidad: el applet funciona sin conexión a Internet, lo cual lo hace apropiado para demostraciones en aulas, en trámites administrativos como el actual, o en entornos con red restringida.

5.6 Limitaciones respecto al paquete Python

- Sólo se exponen los primos $p \in \{2, 3\}$.
- El eje en segundos no está implementado (sólo eje en pulsos).
- El generador pseudoaleatorio del k -medias usa *Mulberry32*, mientras que el paquete Python usa *PCG64* de NumPy — los valores pueden diferir en el quinto decimal en piezas no canónicas. Los pisos estructurales (por ejemplo $\text{Coh}_\pi(2, n) = 0,500$ exacto en BWV~1007) se reproducen exactamente.

6 Reproducibilidad y validación

6.1 Suite de tests

El paquete incluye 28 tests organizados en cuatro niveles:

Nivel	Propósito	# tests
tests/smoke/	Importación de módulos	6
tests/unit/	Funciones puras (residuos, distancia, k -medias, cromas)	16
tests/regression/	CSV byte-equivalentes contra results/verified/	3
tests/paper_values/	Reproducción de valores publicados	3
Total		28

Los tests `paper_values/` verifican explícitamente las afirmaciones numéricas de los manuscritos asociados:

- `test_floor_p2_bwv1007.py` — $\text{Coh}_\pi(2, n) = 0,500$ exacto para todo $n \geq 1$ en BWV~1007.
- `test_sarabande_p3_n3.py` — $\text{Coh}_\pi(3, 3) = 0,901$ en la Sarabanda de BWV~1007 (eje de pulsos).
- `test_prelude_p3_mismatched.py` — $\text{Coh}_\pi(3, n) = 0,358$ en el preludio BWV~1007 cuando $r \neq p$ (ilustra el Corolario~2.4).

6.2 Scripts de orquestación

Script	Acción
<code>scripts/reproduce.sh</code>	Re-corre el pipeline canónico desde cero
<code>scripts/validate.sh</code>	Verifica los hashes SHA-256 de los CSV producidos
<code>scripts/snapshot_version.sh</code>	Genera el ZIP de fuentes y su hash
<code>scripts/make_indautor_dossier.sh</code>	Ensambla el dossier INDAUTOR

6.3 Resultado de la última ejecución

A la fecha de cierre de esta versión (**2026-04-29**), la suite de tests reporta:

```
===== test session starts =====

7.2 Datos de la obra

Tipo de obra	Programa de Computación (art. 13 fr. XI LFDA)
Título completo	PA _{ad} icMIDI — A Python Toolkit for Hierarchical, Ultrametric, and p -adic Analysis of Symbolic Music Data
Versión	1.0.0
Idioma del programa	Inglés (mensajes y API); español (manuales)
Lenguaje de programación	Python 3.10+
Sistema operativo	macOS, Linux, Windows
Lugar de creación	Mérida, Yucatán, México
Fecha de primera fijación	2026-02-06
Fecha de la versión registrada	2026-04-29
Carácter de la titularidad	Titular originario (autor único)
Licencia del código fuente	MIT (texto íntegro en LICENSE)
Licencia de la documentación	CC-BY 4.0

7.3 Identificación criptográfica del paquete

Archivo de fuentes	indautor/padicmidi-v1.0.0-source.zip
Tamaño	508 372 bytes ($\approx$ 496 KB)
SHA-256	cbfb8bab6b9a03d086d0a9463668572d150e5ee7bfd1c93a6ba83d89c44e3ef3

El manifiesto completo de archivos individuales con sus hashes SHA-256 se encuentra en el apéndice~B.

7.4 Declaración bajo protesta de decir verdad

El suscrito declara que la obra cuyo registro se solicita es de su autoría original e individual; que no se han incluido fragmentos de obra de terceros sin la debida atribución, las cuales constan en el archivo CONTRIBUTION-STATEMENT.md del paquete; que la obra no infringe derechos de autor, derechos conexos ni derechos industriales de terceros; y que la información proporcionada en este reporte y en el formato RPDA-03 anexo es veraz y completa.

```

A.2.2 src/padicmidi/core/echo.py

```

1  #!/usr/bin/env python3
2  """
3  padicmidi.core.echo – Phase I motor of PAdicMIDI.
4
5  Verbatim copy of the canonical file ``profinite_echo_midi.py`` from the
6  research project repository. Outputs are bit-equivalent to the original
7  under macOS arm64 with Python 3.13.3 and the dependencies listed in
8  ``requirements-pinned.txt``.
9
10 The historical docstring follows.
11
12 Profinite Echo / p-adic Precision Tower for MIDI (with harmonic context).
13
14 Core objects (see docstrings):
15 - bin_size  $\Delta$  (seconds); MIDI  $\rightarrow$  events (t_on, t_off, pitch, velocity).
16 - Duration-weighted chroma series  $H[t\_bin] \in \mathbb{R}^{12}$ , L1-normalized per bin.
17 - For prime  $p$  and level  $n$ :  $N = p^n$ ; patterns  $D_n$  = windows of  $H$  of length  $N$ .
18 -  $d_n(a, b) = \sqrt{\text{mean}_i ||a[i] - b[i]||_2^2}$ .
19 -  $G_{n\delta}()$ : vertices = patterns; edge if  $d_n \leq \delta$ .
20 - Invariants:  $|D_n|$  (windows sampled),  $\text{beta0}(n) = \#\text{connected components in } G_{n\delta}()$ .
21
22 Hypothesis:  $p=2$  aligns with binary subdivision,  $p=3$  with ternary; compare  $n \rightarrow \text{beta0}(n)$ ,  $n \rightarrow |D_n|$ .
23
24 Script: Phase I: --phase1-only --save <prefix>; beats: --time-axis beats --bin-beats 0.083333.
25 Multi-piece: use scripts/run_benchmark.py. Use out_seconds_<piece>_ and out_beats_<piece>_ (do not mix).

A.2.3 src/padicmidi/core/hierarchical.py

```

1  #!/usr/bin/env python3
2  """
3  padicmidi.core.hierarchical – p-adic tower with forced inverse system.
4
5  Hierarchical dictionaries ``S_n`` together with the explicit inverse map
6  ``pi_{n+1,n}: S_{n+1} -> S_n`` that forces each child to inherit a parent
7  by construction. Computes the coherence invariants
8  ``Coh_pi(p, n)`` and ``Coh_grid(p, n)`` and writes the per-parent audit
9  table that allows verification of hypotheses (SC) and (AI) of the
10 null-floor proposition.
11
12 Construction summary:
13 * ``S_1`` is obtained via K-means on a sample of windows of length p.
14 * For every ``n -> n+1`` the parent of an aggregated window
15 ``W_{p,n+1}(b)`` is its truncation projected onto ``S_n``; per-parent
16 K-means with ``Kchild`` clusters yields ``S_{n+1}``;
17 ``pi(child_id) = parent_id`` by construction.
18
19 Outputs (one file per CSV):
20 * ``params.json``, ``params.txt``
21 * ``S_n_prototypes_{p}_{n}.csv``
22 * ``pi_{p}_{n+1}_to_n.csv``
23 * ``f_{p}_{n}.csv``

A.3 Adaptadores de entrada/salida (io/)

A.3.1 src/padicmidi/io/midi_mido.py

```

1  """
2  padicmidi.io.midi_mido – default MIDI adapter (re-export from the canonical motor).
3
4  This module exists for two reasons:
5
6  1. To keep ``padicmidi.io.*`` as a stable public surface for users who
7     want to swap implementations.
8  2. To document explicitly that the gold-standard CSVs in
9     ``results/verified`` were produced with ``mido``.
10
11 The actual parsing is implemented in :mod:`padicmidi.core.echo`; this
12 module simply re-exports the two parsing functions.

```

A.3.2 src/padicmidi/io/midi_pretty.py

```

1  """
2  padicmidi.io.midi_pretty – optional MIDI adapter using ``pretty_midi``.
3
4  This adapter exists for compatibility with workflows that prefer
5  ``pretty_midi``. It reproduces the same ``(t_on, t_off, pitch, velocity)``
6  quadruples emitted by :mod:`padicmidi.io.midi_mido`, but with two
7  caveats:
8
9  * Numerical outputs may differ from the gold standard at the 4-th5th
10 decimal place because ``pretty_midi`` uses a different tick-to-second
11 resolution model under tempo changes.
12 * This adapter requires the optional dependency ``pretty_midi``;
13   install with ``pip install padicmidi[pretty]``.
14
15 Use this adapter only when you cannot install ``mido`` or when you want
16 to cross-validate the parsing layer.

B Manifiesto SHA-256 del dossier

El siguiente manifiesto enumera todos los archivos del dossier INDAUTOR con su hash SHA-256 individual. Cualquier modificación posterior de cualquiera de estos archivos invalidaría el hash global del ZIP de fuentes. El manifiesto se regenera automáticamente con el script `scripts/make_indautor_dossier.sh`.

```
# Manifest of files in the INDAUTOR dossier – 2026-04-30T03:09:32Z

C Cómo subir el software a la página personal

El paquete está preparado para ser publicado en <http://personal.cimat.mx:8181/~rogelio.perez/desarrollo-tecnologico/> (URL canónica futura: <https://www.cimat.mx/~rogelio.perez/desarrollo-tecnologico/>). La carpeta web-site/ contiene exactamente cuatro archivos HTML autocontenidos listos para subir tal cual:

```
web-site/|—
index.html      Landing en español (página principal)|—
index.en.html   Landing en inglés|—
applet.html     Applet de análisis (inglés)|—
applet-es.html  Applet de análisis (español)
```

Vía SSH / SCP.

```
# Subir los cuatro archivos HTML al servidor:
scp web-site/*.html rogelio@personal.cimat.mx:~/public_html/desarrollo-tecnologico/padicmidi/

# O bien por rsync:
rsync -av web-site/ rogelio@personal.cimat.mx:~/public_html/desarrollo-tecnologico/padicmidi/
```

Vía sitio Hugo (Hugo Blox). Si la página personal del autor está construida con Hugo, copiar los applets a static/:

```
cp web-demo/applet.html web-demo/applet-es.html \
~/sitio-hugo/static/desarrollo-tecnologico/padicmidi/
```

y enlazar desde la página de *Desarrollo de software* con un <iframe> o un botón “Abrir la demo web”, en línea con el patrón ya empleado para *p-adic GRN Suite*.

Aviso legal sugerido para la página de descarga.

D Resumen de archivos del dossier INDAUTOR

Archivo	Contenido
indautor/RPDA-03-prefilled.md	Pre-llenado del formato oficial
indautor/carta-titularidad.md	Carta de titularidad firmada
indautor/descripcion-funcional.md	Descripción funcional ampliada
indautor/VERSION-REGISTRADA.md	Identificación de la versión y hash global
indautor/manifiesto-archivos.md	Hashes SHA-256 individuales
indautor/manual-usuario.md	Manual de usuario (copia)
indautor/manual-tecnico.md	Manual técnico (copia)
indautor/codigo-fuente/	Copia del paquete src/padicmidi/
indautor/evidencia-corridas/	Logs de tests y quickstart con CSV resultantes
indautor/padicmidi-v1.0.0-source.zip	Paquete fuente firmado por hash
indautor/REPORTE-TECNICO.pdf	Este documento
